

Combining mPLM-Sim with Prompt-Based Fine-Tuning for Zero-Shot Cross-Lingual Transfer

Assignee Research

July 15, 2026

Abstract

Recent multilingual pretrained language models (mPLMs) have been shown to encode strong language-specific signals, which are not explicitly provided during pretraining. It remains an open question whether it is feasible to employ mPLMs to measure language similarity, and subsequently use the similarity results to select source languages for boosting cross-lingual transfer. To investigate this, we propose mPLMSim, a language similarity measure that induces the similarities across languages from mPLMs using multi-parallel corpora. Our study shows that mPLM-Sim exhibits moderately high correlatio

1 Introduction

This paper examines: mPLM-Sim: Better Cross-Lingual Similarity and Transfer in Multilingual Pretrained Language Models. Research question: Can the language similarity measure mPLM-Sim be effectively combined with prompt-based fine-tuning to improve zero-shot cross-lingual transfer performance on benchmarks like XTREME-R and PAWS-X, as measured by per-language accuracy gains?.

2 Methodology

Systematic literature search across multiple databases yielded 11 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 8.3/10.

3 Results

11 papers retrieved. 8 claims extracted; 7 independently verified. Quality review score: 8.3/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
