

Domain-Specific Fine-Tuning (E.G., Python Vs. Javascript) Performance On Gpt-4O'S Code Generation Robustness As

Assignee Research

May 31, 2026

Abstract

This report synthesises findings from 14 peer-reviewed papers addressing the following research question: How does domain-specific fine-tuning (e.g., Python vs. JavaScript) affect GPT-4o's code generation robustness as measured by HumanEval+ test suite accuracy. Large Language Models (LLMs) have demonstrated significant capabilities in understanding and analyzing code for security vulnerabilities, such as Common Weakness Enumerations (CWEs). However, their reliance on cloud infrastructure and substantial computational requirements pose. 12 claims were extracted from source literature; 1 was independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 4.4/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Case Study: Fine-tuning Small Language Models for Accurate and Private CWE Detection in Python Code. Research question: How does domain-specific fine-tuning (e.g., Python vs. JavaScript) affect GPT-4o's code generation robustness as measured by HumanEval+ test suite accuracy?.

2 Methodology

Systematic literature search across multiple databases yielded 14 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 4.4/10.

3 Results

14 papers retrieved. 12 claims extracted; 1 independently verified. Quality review score: 4.4/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
