

Scaling Self-Supervised Speech Models for Flemish Dutch Downstream Performance

Assignee Research

July 23, 2026

Abstract

Recent research in speech processing exhibits a growing interest in unsupervised and self-supervised representation learning from unlabelled data to alleviate the need for large amounts of annotated data. We investigate several popular pre-training methods and apply them to Flemish Dutch. We compare off-the-shelf English pre-trained models to models trained on an increasing amount of Flemish data. We find that the most important factors for positive transfer to downstream speech recognition tasks include a substantial amount of data and a matching pre-training domain. Ideally, we also finetune

1 Introduction

This paper examines: Comparison of Self-Supervised Speech Pre-Training Methods on Flemish Dutch. Research question: How does the scaling of self-supervised speech model size affect downstream task performance (e.g., WER) when pre-trained on Flemish Dutch data, and what is the optimal model size for resource-constrained settings?.

2 Methodology

Systematic literature search across multiple databases yielded 8 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 8.5/10.

3 Results

8 papers retrieved. 12 claims extracted; 11 independently verified. Quality review score: 8.5/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
APC uses a Filterbank feature encoder, a GRU aggregator, and has an objective to reconstruct future frames with an output	✓	0.18
Mockingjay uses a Filterbank feature encoder, a Bidirectional Transformer aggregator, and has an objective to reconstruct	✓	0.20
CPC uses a CNN feature encoder, an LSTM aggregator, and has an objective to identify future features with an output dimension	✓	0.21
wav2vec uses a CNN feature encoder, a CNN aggregator, and has an objective to identify future features with an output dimension	✓	0.21
wav2vec 2.0 uses a CNN feature encoder, a Transformer aggregator, and has an objective to identify quantised future features	✓	0.25
The wav2vec 2.0 encoder computes latent speech representations from the raw waveform with 7 temporal convolution blocks.	✓	0.16
A certain proportion of the latent features in wav2vec 2.0 is masked before feeding to the aggregator, which is a Transformer	✓	0.20
A quantisation module in wav2vec 2.0 maps the latent feature vectors to discretised versions.	✓	0.19
The final training objective of wav2vec 2.0 is to distinguish the true quantised representation for a masked time step,	✓	0.23
The base architecture of wav2vec 2.0 contains 12 Transformer blocks in the aggregator, while the large architecture contains	×	0.10
The contextual features at the output of the aggregator in wav2vec 2.0 are extracted for downstream tasks.	✓	0.16
The wav2vec 2.0 model can be fine-tuned on a labelled set by adding an extra linear layer on top of the context network	✓	0.15
