

FlashSpeech and Autoregressive Models in Prosody Preservation under Latency Constraints

Assignee Research

June 8, 2026

Abstract

This report synthesises findings from 11 peer-reviewed papers addressing the following research question: How does FlashSpeech’s prosody preservation score on LibriTTS-R compare to autoregressive baselines when both are constrained to identical latency budgets. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 6.3/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Hierarchical prosody modeling and control in non-autoregressive parallel neural TTS. Research question: How does FlashSpeech’s prosody preservation score on LibriTTS-R compare to autoregressive baselines when both are constrained to identical latency budgets?.

2 Methodology

Systematic literature search across multiple databases yielded 11 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 6.3/10.

3 Results

11 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 6.3/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
