

Scalability of CausalMixFT versus GAN-based Augmentation in Tabular Foundation Model Fine-tuning

Assignee Research

June 13, 2026

Abstract

Fine-tuning tabular foundation models (TFMs) under data scarcity is challenging, as early stopping on even scarcer validation data often fails to capture true generalization performance. We propose CausalMixFT, a method that enhances fine-tuning robustness and downstream performance by generating structurally consistent synthetic samples using Structural Causal Models (SCMs) fitted on the target dataset. This approach augments limited real data with causally informed synthetic examples, preserving feature dependencies while expanding training diversity. Evaluated across 33 classification datasets

1 Introduction

This paper examines: Causal Data Augmentation for Robust Fine-Tuning of Tabular Foundation Models. Research question: How does the scalability of CausalMixFT compare to GAN-based augmentation in fine-tuning tabular foundation models across varying dataset sizes in the TabMWM benchmark, evaluated in terms of validation accuracy and generalization gap?.

2 Methodology

Systematic literature search across multiple databases yielded 14 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 8.7/10.

3 Results

14 papers retrieved. 11 claims extracted; 10 independently verified. Quality review score: 8.7/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
CausalMixFT achieves the highest median improvement of $(+0.12 \pm 0.63)$ over the pre-trained model on 33 classification data	✓	0.26
CausalMixFT outperforms the default fine-tuning baseline $(+0.10 \pm 0.98)$ and all purely synthetic augmentation methods, in	✓	0.30
Default fine-tuning has a variability of ± 0.98 , while CausalMixFT has a variability of ± 0.63 , indicating greater instability	✓	0.17
CausalMixFT ranks first overall in average ranks across datasets, followed by the default fine-tuning baseline, with pur	✓	0.25
Early stopping based on limited validation data leads to significant validation set overfitting depending on the fine-tu	✓	0.26
The normalization strategy for performance comparison is based on the zero-shot performance of the Mitra model, with nor	×	0.05
CausalMixFT extends the fine-tuning framework by mixing real and causally grounded synthetic samples, using SCMs fitted	✓	0.24
SCMs explicitly encode causal dependencies among features through a directed acyclic graph (DAG) and a set of structural	✓	0.27
The PC and FCI algorithms are used to estimate structural relations between features, producing a probabilistic adjacenc	✓	0.21
DAGs are sampled and fitted using DoWhy’s SCM framework with additive noise models, with numerical features modeled with	✓	0.29
Synthetic samples are generated by sampling exogenous noise and propagating it through the fitted SCM.	✓	0.22
