## Abstract

This report synthesises findings from 11 peer-reviewed papers addressing the following research question: What is the impact of the batch-ensemble mechanism on the robustness of BE-SNNs compared to standard SNNs when evaluated on adversarial samples in tabular datasets, measured by accuracy degradation. 8 claims were extracted from source literature; 4 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 6.5/10. This report is a machine-generated literature synthesis and does not constitute original research.

## 1 Introduction

This paper examines: Enhancing Adversarial Robustness in SNNs with Sparse Gradients. Research question: What is the impact of the batch-ensemble mechanism on the robustness of BE-SNNs compared to standard SNNs when evaluated on adversarial samples in tabular datasets, measured by accuracy degradation and inference efficiency?.

## 2 Methodology

Systematic literature search across multiple databases yielded 11 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 6.5/10.

## 3 Results

11 papers retrieved. 8 claims extracted; 4 independently verified. Quality review score: 6.5/10.

## 4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
