

Knowledge Base Diversity and Code Execution Success in MBPP Retrieval Pipelines

Assignee Research

June 8, 2026

Abstract

This report synthesises findings from 15 peer-reviewed papers addressing the following research question: What is the correlation between knowledge base diversity and code execution success rates in evolving retrieval pipelines when evaluated on the MBPP dataset. 10 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.5/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: EVOR: Evolving Retrieval for Code Generation. Research question: What is the correlation between knowledge base diversity and code execution success rates in evolving retrieval pipelines when evaluated on the MBPP dataset?.

2 Methodology

Systematic literature search across multiple databases yielded 15 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.5/10.

3 Results

15 papers retrieved. 10 claims extracted; 0 independently verified. Quality review score: 3.5/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
Existing code generation approaches perform poorly on EVOR-BENCH.	×	0.15
With CodeLlama, the improvements of MPSC, ExeDec, and Reflexion are smaller than 2% on average, compared to the vanilla	×	0.04
The execution accuracy remains 0 in Ring across three methods (MPSC, ExeDec, Reflexion).	×	0.06
DocPrompting significantly surpasses MPSC, ExeDec, and Reflexion by a large margin.	×	0.03
EVOR achieves 16.1% and 16.2% absolute gain with ChatGPT and CodeLlama respectively on top of DocPrompting.	×	0.05
DocPrompting only uses the documentation as a single retrieval source, without evolution in both queries and knowledge.	×	0.13
The default configuration of EVOR uses execution accuracy (pass@1) as the metric.	×	0.06
Vanilla generation directly gets outputs from LLMs based on the coding question without augmenting external knowledge.	×	0.09
MPSC incorporates both inter- and intra consistency and prompts LLMs to generate diverse outputs from three perspectives	×	0.02
ExeDec employs a subgoal model to predict the subgoal of the desired program state for the next part of the program and	×	0.03
