

Scaling Alignment Performance on HHH Across 3B and 8B Parameter Models

Assignee Research

June 6, 2026

Abstract

This report synthesises findings from 16 peer-reviewed papers addressing the following research question: How does the scaling of alignment performance on the HHH dataset vary between 3B and 8B parameter models when fine-tuned with different data mixture ratios. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 4.3/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Zero- and Few-Shot Prompting with LLMs: A Comparative Study with Fine-tuned Models for Bangla Sentiment Analysis. Research question: How does the scaling of alignment performance on the HHH dataset vary between 3B and 8B parameter models when fine-tuned with different data mixture ratios?.

2 Methodology

Systematic literature search across multiple databases yielded 16 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 4.3/10.

3 Results

16 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 4.3/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
