

Comparative Performance of CausalMixFT and TabGAN for High-Dimensional Tabular Data Augmentation

Assignee Research

June 12, 2026

Abstract

Generative models have revolutionized multiple domains, yet their application to tabular data remains underexplored. Evaluating generative models for tabular data presents unique challenges due to structural complexity, large-scale variability, and mixed data types, making it difficult to intuitively capture intricate patterns. Existing evaluation metrics offer only partial insights, lacking a comprehensive measure of generative performance. To address this limitation, we propose three novel evaluation metrics: FAED, FPCAD, and RFIS. Our extensive experimental analysis, conducted on three stan

1 Introduction

This paper examines: Evaluating Generative Models for Tabular Data: Novel Metrics and Benchmarking. Research question: How does the performance of CausalMixFT compare to GAN-based data augmentation methods like TabGAN in terms of downstream task accuracy when fine-tuning on high-dimensional tabular datasets (e.g., >100 features) as measured by metrics like AUC or F1-score on benchmarks like the Yelp review dataset?.

2 Methodology

Systematic literature search across multiple databases yielded 9 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 7.2/10.

3 Results

9 papers retrieved. 15 claims extracted; 12 independently verified. Quality review score: 7.2/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
The experimental analysis was conducted on three standard network intrusion detection datasets.	✓	0.25
The study compares the proposed metrics with established evaluation methods including Fidelity, Utility, TSTR, and TRTS.	✓	0.21
FAED effectively captures generative modeling issues that are overlooked by existing metrics.	✓	0.29
FPCAD exhibits promising performance but requires further refinements to enhance reliability.	✓	0.19
The study introduces three novel evaluation metrics named FAED, FPCAD, and RFIS.	×	0.12
The study simulates real-world generative modeling challenges by embedding Quality Decrease, Mode Drop, and Mode Collaps	✓	0.29
Experimental results demonstrate that FAED successfully detects all synthesized problems (Quality Decrease, Mode Drop, a	✓	0.25
Existing metrics fail to identify key generative modeling issues such as Quality Decrease, Mode Drop, and Mode Collapse.	✓	0.31
Inception Score (IS) and Frchet Inception Distance (FID) are standard quantitative metrics for evaluating generative mo	✓	0.19
TSTR involves training a classifier on synthetic data and testing it on real data.	×	0.15
TRTS involves training a classifier on real data and testing it on synthetic data.	×	0.15
A high TSTR accuracy suggests that synthetic data effectively approximates real-world distributions.	✓	0.25
A high TRTS score indicates that the synthetic data retains key characteristics of the real data.	✓	0.25
TSTR is particularly useful for detecting cases where synthetic data only partially represents real data.	✓	0.26
TRTS assesses whether synthetic samples introduce patterns absent in real data.	✓	0.23
