

Code-Mixing Data Augmentation and Zero-Shot Transfer in Low-Resource Languages

Assignee Research

June 7, 2026

Abstract

This report synthesises findings from 15 peer-reviewed papers addressing the following research question: How does code-mixing data augmentation affect zero-shot transfer accuracy on low-resource languages within the XTREME benchmark compared to monolingual training baselines. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 6.5/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Multilingual Neural Machine Translation for Zero-Resource Languages. Research question: How does code-mixing data augmentation affect zero-shot transfer accuracy on low-resource languages within the XTREME benchmark compared to monolingual training baselines?.

2 Methodology

Systematic literature search across multiple databases yielded 15 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 6.5/10.

3 Results

15 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 6.5/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
