

Scaling Intermediate-Task Data Size and Zero-Shot Cross-Lingual Performance in Multilingual LLMs

Assignee Research

July 24, 2026

Abstract

Intermediate-task training—fine-tuning a pretrained model on an intermediate task before fine-tuning again on the target task—often improves model performance substantially on language understanding tasks in monolingual English settings. We investigate whether English intermediate-task training is still helpful on non-English target tasks. Using nine intermediate language-understanding tasks, we evaluate intermediate-task transfer in a zero-shot cross-lingual setting on the XTREME benchmark. We see large improvements from intermediate training on the BUCC and Tatoeba sentence retrieval tas

1 Introduction

This paper examines: English Intermediate-Task Training Improves Zero-Shot Cross-Lingual Transfer Too. Research question: How does scaling the intermediate-task training data size affect the zero-shot cross-lingual performance of multilingual LLMs on XTREME-R benchmarks when evaluated using the HHH score and TruthfulQA metrics?.

2 Methodology

Systematic literature search across multiple databases yielded 10 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 7.7/10.

3 Results

10 papers retrieved. 17 claims extracted; 13 independently verified. Quality review score: 7.7/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
Intermediate-task training on SQuAD, MNLI, and HellaSwag yields large target-task improvements of 8.2, 7.5, and 7.0 point	✓	0.27
Multi-task intermediate-task training on all 9 tasks performs best, improving by 8.7 points.	✓	0.25
Applying intermediate-task training to BUCC and Tatoeba, the two sentence retrieval target tasks that have no training d	✓	0.30
TyDiQA shows consistent improvements with many intermediate tasks, whereas XNLI does not see benefits from intermediate	✓	0.17
Evaluating the best performing models for each target task on the XTREME benchmark yields an average improvement of 5.4	✓	0.33
Training on English intermediate tasks outperforms the more complex alternatives of (i) continuing multilingual MLM duri	✓	0.32
The pretrained XLM-R Large model achieves state-of-the-art performance on many zero-shot cross-lingual transfer tasks.	✓	0.22
The XTREME benchmark aims to evaluate zero-shot cross-lingual transfer performance across diverse target tasks across up	✓	0.22
