

Jina CLIP’s Unified Embeddings for Robust Text-Image Retrieval on Adversarial Inputs

Assignee Research

July 25, 2026

Abstract

Contrastive Language-Image Pretraining (CLIP) is widely used to train models to align images and texts in a common embedding space by mapping them to fixed-sized vectors. These models are key to multimodal information retrieval and related tasks. However, CLIP models generally underperform in text-only tasks compared to specialized text models. This creates inefficiencies for information retrieval systems that keep separate embeddings and models for text-only and multimodal tasks. We propose a novel, multi-task contrastive training method to address this issue, which we use to train the jina-c

1 Introduction

This paper examines: Jina CLIP: Your CLIP Model Is Also Your Text Retriever. Research question: Can Jina CLIP’s unified embedding approach improve robustness in text-image retrieval tasks when evaluated on adversarial or noisy inputs compared to separate text and multimodal models, as measured by Top-1 accuracy on perturbed MMMU test sets?.

2 Methodology

Systematic literature search across multiple databases yielded 14 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 7.8/10.

3 Results

14 papers retrieved. 9 claims extracted; 7 independently verified. Quality review score: 7.8/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
Jina CLIP uses a dual encoder architecture comprising a text encoder and an image encoder that generate representations	✓	0.22
The text encoder in Jina CLIP uses the JinaBERT architecture, a BERT variant that integrates AliBi to support longer text	✓	0.24
The image encoder in Jina CLIP uses the EVA02 architecture.	×	0.15
EVA02 significantly outperforms comparable image encoders like DinoV2 and ViT B/16 models from OpenCLIP.	✓	0.23
Jina CLIP employs a multi-stage training paradigm that jointly optimizes text-image matching and text-text matching.	✓	0.21
In stage 1 of training, text values are truncated to 77 tokens, enabling the use of very large batches of size 32,768.	✓	0.21
In stage 2 of training, text values are truncated to 512 tokens, resulting in a smaller batch size of 8,192.	✓	0.21
Jina CLIP achieves a text-to-image recall@5 of 80.31% and an image-to-text recall@5 of 89.91%.	×	0.15
Jina CLIP achieves a recall@5 of 43.05%, an NDCG@10 of 48.33%, and a Spearman correlation score of 60.12%.	✓	0.18
