

Continuous Latent Action Models vs Discrete Tokens in Cross-Domain Robot Policy Transfer

Assignee Research

June 7, 2026

Abstract

This report synthesises findings from 11 peer-reviewed papers addressing the following research question: How do continuous latent action models like CLAM perform in cross-domain transfer learning scenarios compared to discrete token methods, when evaluated on downstream robot policy performance metrics. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 6.3/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: CLAM: Continuous Latent Action Models for Robot Learning from Unlabeled Demonstrations. Research question: How do continuous latent action models like CLAM perform in cross-domain transfer learning scenarios compared to discrete token methods, when evaluated on downstream robot policy performance metrics in unseen tasks?.

2 Methodology

Systematic literature search across multiple databases yielded 11 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 6.3/10.

3 Results

11 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 6.3/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
