

Scaling Parameter Count in Tabular Foundation Models and Few-Shot AUC Performance

Assignee Research

June 7, 2026

Abstract

This report synthesises findings from 13 peer-reviewed papers addressing the following research question: How does increasing the parameter count of tabular foundation models pretrained on synthetic data affect their few-shot AUC performance on cross-domain benchmarks compared to XGBoost baselines. 12 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.5/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Robust Tabular Foundation Models. Research question: How does increasing the parameter count of tabular foundation models pretrained on synthetic data affect their few-shot AUC performance on cross-domain benchmarks compared to XGBoost baselines?.

2 Methodology

Systematic literature search across multiple databases yielded 13 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.5/10.

3 Results

13 papers retrieved. 12 claims extracted; 0 independently verified. Quality review score: 3.5/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
Tabular foundation models (TFMs) rely on in-context learning (ICL) for classification and regression tasks with structure	×	0.11
TFMs can produce high-quality predictions on new datasets in milliseconds when GPU-accelerated.	×	0.07
Training TFMs relies on generating diverse synthetic datasets constructed from structural causal models (SCMs).	×	0.07
All current publicly available competitive TFMs have been pretrained on datasets generated from a fixed prior distribution	×	0.06
Fixed priors in TFM training underrepresent certain regions of the parameter space, potentially degrading performance on	×	0.05
State-of-the-art TFMs lag behind tree-based methods on some benchmarks.	×	0.05
The proposed RTFM method was applied to TabPFN V2.	×	0.11
Applying RTFM to TabPFN V2 with only 90k additional training datasets significantly improved its ranking on several real	×	0.11
The maximization stage of the proposed algorithm uses a black-box optimization algorithm to search the SCM parameter space	×	0.02
In the described implementation, estimating the optimality gap with $n_{ds}=20$ and $e=7$ takes a matter of seconds when parallel	×	0.03
The benchmark table includes synthetic dataset configurations with feature counts ranging from 5 to 128.	×	0.04
The benchmark table includes synthetic dataset configurations using activation functions such as tanh, identity, elu, an	×	0.04
