

Scaling Unlabeled Demonstrations in RT-1: CLAM Latent Actions vs. Discrete Token Models

Assignee Research

June 7, 2026

Abstract

This report synthesises findings from 6 peer-reviewed papers addressing the following research question: What is the impact of scaling the number of unlabeled demonstrations on the RT-1 benchmark performance when using CLAM's latent action models versus discrete token-based approaches. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.8/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: CLAM: Continuous Latent Action Models for Robot Learning from Unlabeled Demonstrations. Research question: What is the impact of scaling the number of unlabeled demonstrations on the RT-1 benchmark performance when using CLAM's latent action models versus discrete token-based approaches?.

2 Methodology

Systematic literature search across multiple databases yielded 6 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.8/10.

3 Results

6 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 3.8/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
