

Differentially Private Low-Rank Reparameterization Performance in Few-Shot SuperGLUE Tasks

Assignee Research

June 8, 2026

Abstract

This report synthesises findings from 10 peer-reviewed papers addressing the following research question: Does differentially private low-rank reparameterization maintain comparable performance to non-private baselines on few-shot learning scenarios within the SuperGLUE benchmark suite. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.8/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: FHIST: A Benchmark for Few-shot Classification of Histological Images. Research question: Does differentially private low-rank reparameterization maintain comparable performance to non-private baselines on few-shot learning scenarios within the SuperGLUE benchmark suite?.

2 Methodology

Systematic literature search across multiple databases yielded 10 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.8/10.

3 Results

10 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 3.8/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
