

FlashSpeech Zero-Shot Cross-Domain Speech Synthesis Performance vs. VALL-E and AudioGen

Assignee Research

June 8, 2026

Abstract

This report synthesises findings from 12 peer-reviewed papers addressing the following research question: How does FlashSpeech perform in zero-shot cross-domain speech synthesis (e.g., non-English languages or emotional speech) in terms of WER and inference latency compared to VALL-E and AudioGen. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.8/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Word-Level Emotional Expression Control in Zero-Shot Text-to-Speech Synthesis. Research question: How does FlashSpeech perform in zero-shot cross-domain speech synthesis (e.g., non-English languages or emotional speech) in terms of WER and inference latency compared to VALL-E and AudioGen?.

2 Methodology

Systematic literature search across multiple databases yielded 12 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.8/10.

3 Results

12 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 3.8/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
