Abstract

This report synthesises findings from 16 peer-reviewed papers addressing the following research question: What is the impact of domain-adaptive RAG on the calibration metrics and false positive rates of quantized Mistral 7B when detecting anomalies in multimodal cyber-physical system logs. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 6.0/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: No Need to Know Physics: Resilience of Process-based Model-free Anomaly Detection for Industrial Control Systems. Research question: What is the impact of domain-adaptive RAG on the calibration metrics and false positive rates of quantized Mistral 7B when detecting anomalies in multimodal cyber-physical system logs?.

2 Methodology

Systematic literature search across multiple databases yielded 16 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 6.0/10.

3 Results

16 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 6.0/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
