

Synthetic Video Feature Generalization to Unseen Gesture Classes in Pre-Trained Models

Assignee Research

June 6, 2026

Abstract

This report synthesises findings from 12 peer-reviewed papers addressing the following research question: Can feature representations from synthetic video training generalize to unseen gesture classes in large pre-trained models without fine-tuning, as measured by top-1 accuracy on the NVGesture dataset. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.3/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: An Evaluation of Large Pre-Trained Models for Gesture Recognition using Synthetic Videos. Research question: Can feature representations from synthetic video training generalize to unseen gesture classes in large pre-trained models without fine-tuning, as measured by top-1 accuracy on the NVGesture dataset?.

2 Methodology

Systematic literature search across multiple databases yielded 12 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.3/10.

3 Results

12 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 3.3/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
