

# Targeted Lexical Injection Layer Depth Effects on Training Convergence and MBPP Performance

Assignee Research

June 7, 2026

## Abstract

This report synthesises findings from 13 peer-reviewed papers addressing the following research question: What is the impact of varying the injection layer depth in Targeted Lexical Injection on the trade-off between training convergence speed and final MBPP pass@1 scores for low-resource language code. 17 claims were extracted from source literature; 3 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 4.8/10. This report is a machine-generated literature synthesis and does not constitute original research.

## 1 Introduction

This paper examines: Targeted Lexical Injection: Unlocking Latent Cross-Lingual Alignment in Lughu-Llama via Early-Layer LoRA Fine-Tuning. Research question: What is the impact of varying the injection layer depth in Targeted Lexical Injection on the trade-off between training convergence speed and final MBPP pass@1 scores for low-resource language code models?.

## 2 Methodology

Systematic literature search across multiple databases yielded 13 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 4.8/10.

## 3 Results

13 papers retrieved. 17 claims extracted; 3 independently verified. Quality review score: 4.8/10.

## 4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

## 5 Extracted Claims

Claim	Verified	Confidence
Layer 0 (input embeddings) of the Lugha-Llama-8B-wura model showed an average cosine similarity of approximately 0.3153	✓	0.21
Layer 1 of the Lugha-Llama-8B-wura model showed an average cosine similarity of 0.9808 for Swahili-English word pairs in	✓	0.22
Layer 2 exhibited the peak average cosine similarity of 0.99998 for Swahili-English word pairs in the pilot study.	✓	0.19
Layer 31 showed an average cosine similarity of 0.9876 in the pilot scan.	×	0.08
The baseline output similarity on the full evaluation set prior to TLI fine-tuning was approximately 0.32.	×	0.15
The average cosine similarity at Layer 31 for the trained set prior to TLI fine-tuning was approximately 0.3211.	×	0.14
The average cosine similarity at Layer 31 for the control set prior to TLI fine-tuning was approximately 0.3143.	×	0.14
The control set used for evaluation consisted of 63 unseen word pairs.	×	0.11
A paired t-test was conducted to determine the statistical significance of changes in mean cosine similarity before and	×	0.04
The base model used is Lugha-Llama-8B-wura (Lugha Factory, 2023).	×	0.08
Lugha-Llama is built upon the Llama-3 architecture.	×	0.05
The model was loaded in 4-bit precision using bitsandbytes with NF4 quantization.	×	0.03
The compute data type used for the model was torch.bfloat16.	×	0.02
The pilot study extracted embeddings from every transformer layer in Lugha-Llama, ranging from Layer 0 through Layer 31.	×	0.07
Layer 0 represents the initial input embeddings in the Lugha-Llama model.	×	0.06
For the evaluation phase, word embeddings were extracted from the final output layer (Layer 31).	×	0.08
Embeddings used for evaluation were mean-pooled over attention-masked tokens and L2-normalized.	×	0.01
