

Class Imbalance Effects on Diffusion-Based Tabular Data Sample Quality at Scale

Assignee Research

June 9, 2026

Abstract

This report synthesises findings from 10 peer-reviewed papers addressing the following research question: What is the impact of class imbalance on the sample quality of diffusion-based models for tabular data, as measured by Frchet Distance, when scaling dataset size from 10K to 100K samples. 0 claims were extracted from source literature; 0 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 3.2/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: DiM: Distilling Dataset into Generative Model. Research question: What is the impact of class imbalance on the sample quality of diffusion-based models for tabular data, as measured by Frchet Distance, when scaling dataset size from 10K to 100K samples?.

2 Methodology

Systematic literature search across multiple databases yielded 10 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 3.2/10.

3 Results

10 papers retrieved. 0 claims extracted; 0 independently verified. Quality review score: 3.2/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.
