

Proposed Tabular Generative Model Metrics and Their Ranking Consistency Across Domains

Assignee Research

June 9, 2026

Abstract

This report synthesises findings from 11 peer-reviewed papers addressing the following research question: How do the proposed tabular generative model metrics compare in ranking consistency with existing metrics when evaluated on large-scale, multi-domain tabular benchmarks with varying data distributions. 15 claims were extracted from source literature; 5 were independently verified against retrieved documents. An automated multi-reviewer quality assessment produced a score of 5.2/10. This report is a machine-generated literature synthesis and does not constitute original research.

1 Introduction

This paper examines: Evaluating Generative Models for Tabular Data: Novel Metrics and Benchmarking. Research question: How do the proposed tabular generative model metrics compare in ranking consistency with existing metrics when evaluated on large-scale, multi-domain tabular benchmarks with varying data distributions?.

2 Methodology

Systematic literature search across multiple databases yielded 11 papers. Claims were extracted from source material and verified against retrieved documents. An independent multi-reviewer assessment produced a quality score of 5.2/10.

3 Results

11 papers retrieved. 15 claims extracted; 5 independently verified. Quality review score: 5.2/10.

4 Limitations

This report is a machine-generated literature synthesis and does not constitute original research. Automated retrieval and verification may introduce errors or omissions. Review scores reflect automated assessment, not human peer review. Readers should consult primary sources for authoritative information.

5 Extracted Claims

Claim	Verified	Confidence
The experimental analysis was conducted on three standard network intrusion detection datasets.	✓	0.24
The study compares proposed metrics with established evaluation methods including Fidelity, Utility, TSTR, and TRTS.	✓	0.22
FAED effectively captures generative modeling issues that are overlooked by existing metrics.	✓	0.30
FPCAD exhibits promising performance but requires further refinements to enhance reliability.	✓	0.19
The study introduces three novel evaluation metrics named FAED, FPCAD, and RFIS.	✓	0.20
The study simulates generative modeling challenges by embedding Quality Decrease, Mode Drop, and Mode Collapse issues in	×	0.06
Experimental results demonstrate that FAED successfully detects all synthesized problems (Quality Decrease, Mode Drop, a	×	0.07
Existing metrics fail to identify key generative modeling issues in the conducted experiments.	×	0.13
TSTR involves training a classifier on synthetic data and testing it on real data.	×	0.03
TRTS involves training a classifier on real data and testing it on synthetic data.	×	0.03
A high TSTR accuracy suggests that synthetic data effectively approximates real-world distributions.	×	0.07
A high TRTS score indicates that the synthetic data retains key characteristics of the real data.	×	0.03
TSTR is particularly useful for detecting cases where synthetic data only partially represents real data.	×	0.04
TRTS assesses whether synthetic samples introduce patterns absent in real data.	×	0.04
Quantitative metrics like Inception Score (IS) and Frchet Inception Distance (FID) are standard for evaluating generati	×	0.11
